# CloudFilter™

# Platform-agnostic email filtering.

The flexibility to protect any environment, your way. CloudFilter is a secure email gateway that delivers full inbound and outbound protection across Microsoft, Google, on-prem, and mixed environments.

### Tunable Filtering
Every client draws a different line on what they want delivered, held, or stopped. Tunable spam categories satisfy them all.

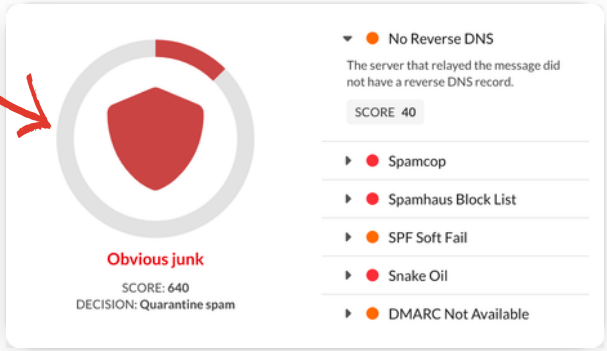
### Effortless Control
Set filtering policies at any level, from your entire base down to a single user, with an ease other gateways can't match.

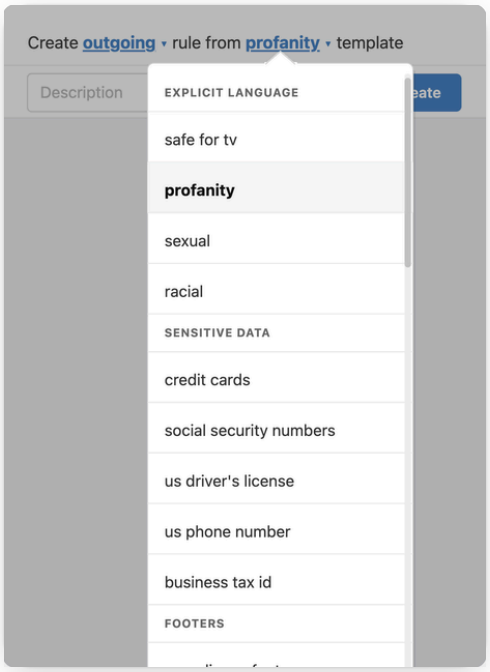
### Safe Self-Service
Users see a risk-flagged preview of any held message and release or block it in one click, inside the boundaries you approve.

MULTI-LAYER DETECTION

## Catches nuance other filters miss.

Machine learning, heuristics, reputation checks, and multiple malware engines evaluate every message at once, producing a probabilistic threat score that accounts for signals other tools treat in isolation.





SAFESEND

## Take control of what leaves your clients' environments.

SafeSend gives admins control over outbound mail: block SSNs, card numbers, and risky attachments with ready-made lexicons or your own rules, or auto-encrypt sensitive messages through Bracket on the way out.

**CAPABILITIES THAT PUT YOU IN CONTROL:**

- Outbound protection built in
- Fine-tune any control
- DMARC enforcement
- DLP rule templates
- Mobile-first admin console
- Works with any email platform
- Automated impersonation detection
- Full audit trail
- Deploys in minutes, no downtime
- MSP-first design
